```
Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[i] - A[j] = k, i!= j.

Input Format

1. First line is number of test cases T. Following T lines contain:
2. N, followed by N integers of the array
3. The non-negative integer k

Output format

Print 1 if such a pair exists and 0 if it doesn't.

Example

Input:

1
3135
4

Output:
```

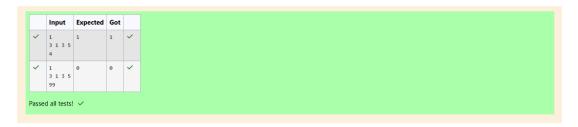

```
Input:

1
3 1 3 5
99

Output:
```

Question 2
Correct
Marked out of 5.00

Flag question

Sam loves chocolates and starts buying them on the 1st day of the year. Each day of the year, x, is numbered from 1 to Y. On days when x is odd, Sam will buy x chocolates; on days when x is even, Sam will not purchase any chocolates.

Complete the code in the editor so that for each day Ni (where  $1 \le x \le N \le Y$ ) in array arr, the number of chocolates Sam purchased (during days 1 through N) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.

Input Format

The program takes an array of integers as a parameter.

**Activate Windows** 

The locked code in the editor handles reading the following input from stdin, assembling it into an array of integers (arr), and calling calculate array. Settings to activate Window

The first line of input contains an integer, T (the number of test cases). Each line i of the T subsequent lines describes the ith test case as an	n integer, Ni (the number of days).
Constraints	
Constraints	
1 ≤ T ≤ 2 × 105	
1 ≤ N ≤ 2 × 106	
$1 \le x \le N \le Y$	
Output Format	
Оцри готпа	
For each test case, Ti in arr, your calculate method should print the total number of chocolates Sam purchased by day Ni on a new line.

2	
3	
Sample Output 0	
Sample Output 0	
1	
1	
4	
Contaction	Activate Windows
Explanation	C + C + C + C + A/C +

```
Test Case 0: N = 1
```

Sam buys 1 chocolate on day 1, giving us a total of 1 chocolate. Thus, we print 1 on a new line.

## Test Case 1: N = 2

Sam buys 1 chocolate on day 1 and 0 on day 2. This gives us a total of 1 chocolate. Thus, we print 1 on a new line.

Sam buys 1 chocolate on day 1, 0 on day 2, and 3 on day 3. This gives us a total of 4 chocolates. Thus, we print 4 on a new line.

## Answer: (penalty regime: 0 %)

```
int t;
scanf("%d",&t);
while(t--){
   int n,c=0;
   scanf("%d",&n);
   for (int i=0;i<=n;i++){
        if(i%2!=0) c=c+i;
   }
printf("%d\n",c);
}</pre>
```

Question 3 Marked out of 7.00

♥ Flag question

The number of goals achieved by two football teams in matches in a league is given in the form of two lists. Consider:

- $\bullet \quad \text{Football team A, has played three matches, and has scored \{\,1\,,2\,,3\,\}\,goals\ in\ each\ match\ respectively.}$
- Football team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
- Your task is to compute, for each match of team B, the total number of matches of team A, where team A has scored less than or equal to the number of goals scored by team B in that match.
- In the above case:
- For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
- For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3.

**Activate Windows** 

Hence, the answer: {2, 3}.

Go to Settings to activate Window

Complete the code in the editor below. The program must return an array of m positive integers, one for each maxes[i] representing the to nums[j] $\leq$ maxes[i] where $0 \leq j < n$ and $0 \leq i < m$ , in the given order.	ital number of elements nums(j) satisfying
It has the following:	
nums[nums[0],nums[n-1]]: first array of positive integers	
maxes[maxes[0],maxes[n-1]]: second array of positive integers	
Constraints	
• 2 ≤ n, m ≤ 105	
• $1 \le nums[j] \le 109$ , where $0 \le j < n$ .	
• $1 \le \max[i] \le 109$ , where $0 \le i < m$ .	
Input Format For Custom Testing	
Input from stdin will be processed as follows and passed to the function.	
The first line contains an integer n, the number of elements in nums.	
The next n lines each contain an integer describing nums[j] where $0 \le j < n$ .	
The next line contains an integer m, the number of elements in maxes.	
The next m lines each contain an integer describing maxes[i] where $0 \le i < m$ .

 3
 4
 Explanation 1
 We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].
 1. For maxes[0] = 3, we have 1 element in nums (nums[0] = 2) that is ≤ maxes[0].
                                                                                                                           Activate Windows
 2. For maxes[1] = 1, there are 0 elements in nums that are \leq maxes[1].
                                                                                                                           Go to Settings to activate Windows
 3. For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are \leq maxes[2].
```

4. For maxes[3] = 8, we have 4 elements in nums (nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are ≤ maxes[3].

Thus, the function returns the array [1, 0, 3, 4] as the answer.

```
Answer: (penalty regime: 0 %)
```

```
for(int j=0;)<52;)++)
{
    ans = 0;
    for(int i=0;i<s1;i++){
        if(tb[j]>=ta[i])
        ans++;
    }
}
printf("%d\n",ans);
}
```
